PROBLEMS AND PROPERTIES INDEX

Mechanical properties of magnesium-rich alloys with aluminum and silver. V. G. Kuznetsov and M. A. Skryabin. *Bull. acad. sci. U.R.S.S., Clisse sci. chim.* 1945, 557-601n (B67-1). - Brinell hardness of Mg-rich alloys with Al and Ag was detd. over 3 radial cross sections, and isoscelers were plotted. The alloys were either quenched at 300°, or slowly or naturally cooled and artificially aged. In the quenched state the hardness increases faster with rising (Ag + Al) content, than for an alloy contg. the same amt. of only one component. The plasticity increases with increasing Ag/Al ratio and in the region of brittle alloys is shifted to higher concns. In the region of the ternary Mg solid soln. Ag increases the hardness more than does Al. For const. Mg content there is a hardness min. for Ag/Al = 1/3, which probably points to the max. of "short-range order" in a solid soln. Annealing and slow cooling increase the hardness somewhat. At room temp. and at 150° no increase in hardness is observed. The data of tensile strength and relative elongation of a series of cast alloys at room temp., 250° and 300° showed an optimum when 0.5-1.5% Ag was added to Mg-Al alloys contg. 3-5% Al. The following two alloys show outstanding properties: 0.5% Ag, 1.21% Al, 0.40% Mn; tensile strength in kg./sq. mm.: 22.8 at quenched, 22.8 after slow cooling, 13.6 at 250°, 10.5 at 300°, and relative elongation of 17.7, 12.1, 23.4, 20.5% resp. The second alloy has the following properties

Investigation of the structure of Fe-CoAl-NiAl alloys.
O. S. Ivanov and M. A. Skrybina. Izv. Akad. Nauk
S.S.R., Otdel. Khim. Nauk 1949, 337-42. From the
results of measurements of magnetic properties it was con-
cluded that the section Fe-CoAl-NiAl of the quaternary
system consists of β phase (α -Fe solid soln.) in the Fe
corner, β_1 phase along the CoAl-NiAl edge, and an in-
tervening two phase region, β and β_1 . Three series of
alloys were used in the work: II having the at. ratio

Co/Ni = 3, III having Co/Ni = 1, and IV having Co/
Ni = $\frac{1}{3}$. For each series the coercive force, resistivity,
and satn. magnetization were detd. as a function of at. %
Fe. The coercive force rose from less than 1 oersted in
the single phase regions to a max. of 188, 320, and 200
in the II, III, and IV series in the two-phase region.
These are not the highest obtainable values since all
alloys were given a homogenizing anneal at 1000-1100°
for 75 hrs. with cooling to 800-300° at a rate of 10-15°
per hr. Room temp. ferromagnetism disappears along
the CoAl-NiAl edge only at Fe contents less than about
5%. A. G. Guy

TITLE: Investigation of the carrying capacity of rectangular-section eccentrically loaded columns of aluminum alloy AD35-T1

SOURCE: ASiA SSSR. Institut stroitel'nykh konstruktsiy. Stroitel'nye konstruktsii iz alyuminiyevkh splavov, no. 2, 1963, 102-111

TOPIC TAGS: aluminum alloy, alloy AD35-T1, construction material, buckling coefficient, stress, aluminum

ABSTRACT: The recently obtained aluminum alloy AD 35-T1 is a candidate for building structures carrying great loads. The alloy is particularly suitable because of its mechanical, technological (weldability, press-formability, suitability for anodizing), and corrosion-resistant properties. For acceptance in construction practice, it is necessary to establish design requirements applicable to this material; in particular, one must determine the values of buckling coefficient ϕ . Hence, the authors carried out investigations at MIIT on the carrying capacity of solid rectangular-section eccentrically-loaded

Card . 1/4

ACCESSION NR: AT4010743

columns of AD35-T1. In these investigations, the same methods were applied as P. N. Polikarpov (professor) and S. A. Popov (one of the authors) used previously at MIIT for eccentrically-loaded columns of low-alloy steel and of the aluminum alloy D1-T, respectively. The present investigation dealt with both the elastic and the elasto-plastic ranges of work. A stress-strain diagram for AD-35-T1 was obtained from compression tests. A reduced modulus of deformation was introduced to account for non-linear stress distributions across the section and for variations of bending along the column axis. As part of the results of the investigation, a chart was constructed (Fig. 1 of the Enclosure) representing critical stresses versus the slenderness ratio λ of columns for a parametric range 0 to 1.2 of relative eccentricity $\frac{a}{r}$ (a - eccentricity; r - radius of gyration of the cross-section). Three formulas according to different design specifications have been given for practical assumptions of total relative eccentricity values to account for the initial curvature of column and for the eccentric application of the compressive load at the end section:

$$\frac{a}{r} = 0.05 + 0.001 \lambda \quad (1)$$

as specified in TUPM-47 MPS (old design specifications for bridges;

$$\frac{a}{r} = 0.125 + 0.0018 \lambda \quad (2)$$

Title : Specific treatment of influenza

Periodical : Vest. AMN SSSR, 4, 34-39, Oct-Dec 1954

Abstract : Powder-like polyvalent serum, mixed with sulfathiazone and penicillin, was found to be dependable and satisfactory in the treatment and prevention of influenza caused by the three types of influenza viruses (A, A₁, and B). This powdered serum must be administered by insufflation into the respiratory tract through the nasal passages; a simple, portable insufflator has been devised for that purpose. Insufflation should take place simultaneously with deep inhalation. Therapeutic effect of this powdered mixture consists of suppression of the influenza virus and of timely prevention of secondary bacterial infections. Curtailment of febrile period depends on specificity of the serum and not on sulfathiazole or penicillin. Tables. Graphs. Charts.

TITLE: From aqualung to sport submarine

SOURCE: Tekhnika - molodezhi, no. 7, 1964, 32-36

TOPIC TAGS: ³⁵ submarine photography, aqualung, swimming, underwater equipment

ABSTRACT: Underwater sporting equipment which can be handcrafted is reported on in this collection of articles. To record underwater scenes, a metal waterproof case has been designed, intended for use with the motion picture camera "Kiev-16." A waterproof flash lamp "EV-5" has been developed which is effective under water up to distances of 0.5 m. It uses two flashlight batteries and has a power of 40 w. Several units can be linked by a synchronizing circuit which fires all lamps when the first lamp flashes. To assist in underwater navigation, a "submerged pilot" has been developed which contains a compass and a log. The log is a four-bladed aluminum 120-mm diameter propeller which turns 300-400 rev in 100 m of path. The blades are set at $\sim 45^\circ$ to the direction of motion and can be twisted slightly

Card 1/3

L 25610-65

for precise calibration of the instrument. Since a swimmer cannot travel much faster than 2.8 km/h, submerged transportation has been developed. The simplest device for underwater travel is a sled towed by a launch, provided with hand controls for depth regulations. A new underwater plastic glider with narrow wings measures 3.5 x 2.4 x 0.8 m. It reaches a speed of 15 km/h when towed, is controlled by horizontal rudders and heeling rudders, and is steered by a rudder on the keel. A device called an aquaped carries bicycle-type pedal gear which turns a screw propeller. The driver, strapped to a saddle, can reach a speed of 5.2 km/h. A more elaborate device called a "submarine scooter," is strapped to the back of a swimmer wearing an aqualung, or is held before him by hand grips. The body is made in two plastic sections covered by thin layers of wood and iron. One compartment contains a 72-amp-h, 24-v storage battery. The other compartment contains the small 350-700-w electric motor and reducing gears. A shaft leads from the rear of this compartment to the screw which can drive it at 10 km/h. The most sophisticated device is the sporting submarine, either the "dry" or the "wet" type. In the "wet" type the submarine is flooded, and the sportsmen wear aqualungs. A one- or two-man type, with an airplane-like cabin, is powered by either a bicycle-type pedal (one man - 5.5 km/h, two man - 9 km/h) or by a 1-hp electric motor (15 km/h). Such a submarine may operate at depths of up to 50 m. A model of the "dry" type

Card 2/3

ACCESSION NR: AP5003788

(hermetically sealed) called the "Mermaid," is still in the "dream" stage. It would have a steel hull 4.6 m long and 1.5 m wide and would weigh 1125 kg. A glass conning tower would provide 360-degree visibility. Speeds of 12 km/h would be possible from a 2-hp electric motor supplied by lead storage batteries. The Mermaid could make 24-km trips, and its air supply would be sufficient for 24 hours. The craft would be well supplied with safety features (including compressed gas for emergency surfacing) and with provisions for the sportsman to be able to abandon a disabled submarine. ORIG. PUB.: V. sb. Ref. nauchno-issled. rabot po khlopkovedstvu. Tashkent, AN UzSSR, 1957, 193-198

ABSTRACT : Experiments conducted by the Academy of Sciences Uzbek SSR in Tashkentskaya Oblast in 1956 have shown that ammoniate (A) was nitrified under laboratory conditions by 70% in 13 days, under field conditions by nearly totally within less than 12 days. There is thus no cause to apply A fractionally under the fall plowing. When placing the entire annual rate of A during vegetation of the cotton, its effectiveness either equalled

tic temperatures) for electromagnetic waves and for one type of plasma wave. The retained portion of the dielectric tensor is put into a form suitable for computation and its behavior in the neighborhood of the cyclotron frequency and its first two harmonics is illustrated with graphs. The resonance term has an anti-Hermitian part (leading to absorption) only for frequencies below the resonance. Expressions are obtained for the refractive indices for the ordinary and the extraordinary electromagnetic waves and for the plasma wave having the smaller index. At the cyclotron frequency the extraordinary wave is much less strongly absorbed than the ordinary wave. The plasma wave having the larger refractive index violates the condition that the wavelength be large compared with the Larmor radius. A method of successive corrections is proposed for dealing with this case. An error is pointed out in a paper by A.A.Rukhadze and V.P.Silin (ZhTF, 32, 423, 1962). Dubnov, Ya. S., and Skrydlov, V. N. The centro-affine theory of surfaces. Trudy Sem. Vektor. Tenzor. Analizu 8, 128-143 (1950). (Russian)

The vector algorithm for centro-affine spaces, derived in the paper reviewed above is here applied to surface theory of space of three dimensions. The equiaffine space is specially studied. Formulas are found for the net of asymptotic lines, the invariant of Tzitzica $T = \frac{1}{2} e^{\alpha_1 \beta_1} R_{\alpha\beta} R_{\alpha_1\beta_1}$ ($R_{\alpha\beta}$ the curvature tensor), and the Čebyšev tensor (the tensor which vanishes when a net is a net of Čebyšev for a given connection). The transition is made to affine centro-projective geometry.

TITLE: Investigations by Belorussian Scientists in the Field of Spectroscopy and Luminescence (Radio-Belorussian Institute for Spectrometry) (Avanastasantsi)

PERIODICL: Vestnik Akademii Nauk SSSR, 1959, Nr. 1, pp. 68-76 (USSR)

ABSTRACT:

These investigations are being carried out at the Institute of Physics and Mathematics (Institute of Physics and Mathematics) and the Physico-Chemical Faculty (Belorussian University under the direction of M. A. Tsvetkovich) of the Belorussian Academy of Sciences. In 1958, A. M. Sevchenko, M. A. Tsvetkovich, and V. I. Fedorov, Corresponding Member of the Belorussian Academy of Sciences, USSR, in the field of theoretical spectroscopy, the investigations by P. A. Ayashevich, B. I. Stepanov, and others, were mentioned. Further, the following investigations are indicated:

B. I. Stepanov, B. I. Zhukhoborovskaya used the general principles of spectroscopy of negatively charged currents in their ionizations.

On the basis of experimental data, A. M. Stepanov obtained important results in the determination of atomic values of optical characteristics of the substances studied, methods of L. A. Kravtsov, E. F. Trunek, oxidized cellulose methods, and absorption with large overlapping of absorption and luminescence spectra.

N. A. Borodarenko succeeded in obtaining fundamental results in the examination of luminescence of phthalocyanine vapors. He also showed that the efficiency of quenching phthalocyanine may be much less than one.

F. D. Shchelkin, under the direction of A. M. Sevchenko, examined the interaction of the solvent on the yield of fluorescence as well as the absorption and emission spectra.

A. M. Sevchenko, D. P. Gorinovich, A. M. Zaritskaya examined the luminescence polarization of many combined molecules. At the same time they designed an improved apparatus.

A. M. Sevchenko, L. V. Ivanashko work in the field of luminescence of rare-earth complexes.

V. A. Filippov, examined the phenomena of phosphorescence. The examinations of optical properties of chlorophyll and related compounds are being carried out in close cooperation with the Institute of Biological Problems of the USSR (Institute of Biology, Academy of Sciences, Belorussian SSR).

S. N. Godunov, L. A. Kravtsov, B. V. Tsvetkovich examined the absorption and luminescence spectra of a liver leaf.

A. M. Serobenko, O. P. Garinovich, E. M. Solntseva, L. A. Terent'ev examined polarization spectra and the dependence of polarization on the wave length of fluorescence.

A. M. Serobenko, L. V. Tolod'ko obtained valuable data of the composition of sugar compounds and the nature of intermolecular forces of interaction.

I. F. Smirnov, examined the optical and electrical properties of some crystal phosphors.

A. M. Stepanov, B. I. Stepanov, A. M. Tsvetkovich, L. A. Terent'ev examined the processes of transformation of cellulose and its products.

E. M. Perel'manovitch, I. M. Terent'ev examined the oxidation of cellulose with the use of absorption spectroscopy in the ultraviolet range.

R. G. Zhankov, L. M. Terent'ev worked at high pressure in order to study the composition of cellulose by means of spectroscopic methods.

I. N. Terent'ev, L. G. Zhankov examined the oxidizing action of cellulose by means of nitrogen dioxide, iodine and chlorine.

A. M. Shchelkin, A. M. Shchelko examined the mercerizing process of cellulose.

E. M. Perel'manovitch, I. M. Terent'ev examined the oxidation of cellulose with the use of absorption spectroscopy in the ultraviolet range.

M. M. Pavlyuchenko and collaborators examined photometrically the absorption of coloring substances on cellulose.

I. N. Terent'ev, E. Z. Goryainova examined the luminescence of cellulose products.

N. I. Stepanov, B. I. Makalintseva determined the dependence of the spectra of dispersed objects on the reduction

ratio, the character of the binding agent, and the layer thickness.

TITLE: Investigations by Belorusssian Scientists in the Field of Spectroscopy and Luminescence (Soboy beloruskikh uchenykh po spektroskopii i lumeneschesstvu)

PERIODICAL: Vestnik Akademii Nauk SSSR, 1959, Nr. 1, pp. 68-76 (USSR)

ABSTRACT: These investigations are being carried out at the Institut fiziki i matematiki (Institute of Physics and Mathematics) and the fizicheskiy fakultet Belorussskogo universiteta (Physics Department, Belorusssian University) under the direction of B. I. Stepanov, A. M. Savchenko, M. A. Pol'yashovich, Academian AS SSSR, and P. I. Fedorov. Corresponding Member, Academy of Sciences, USSR. In the field of theoretical spectroscopy, the investigations by P. A. Panasovich, B. I. Stepanov et al. are mentioned. Further, the following investigations are indicated:

A. P. Ishchivskiy, B. I. Stepanov developed a theory of dispersion light filters. S. I. Gravdachukova, L. Z. Lapshina obtained, by experiment, dispersion light filters for the infrared range.

A. F. Prishivalov analysed the accuracy and the field of application of existing determination methods of optical constants of dispersed and non-dispersed materials.

I. G. Belovashchik, A. A. Labuda, Ya. O. Matizov obtained important results concerning the kinetics of one single spark discharge (spectral intensity and discharge temperature).

A. A. Danikashvili, V. J. Burdukov examined the mutual influence of elements in spectral analysis, and explained the methods for their elimination.

G. V. Oreshkin suggested a series of methods to obtain the infrared spectra of third elements.

G. V. Oreshkin, N. P. Kirovskaya engaged in working out a control method of mercury pentacillin in ordinary penicillin.

K. A. Borisovich, B. F. Maksimovich, A. I. Sviridenko examined the infrared spectra of resinous products.

N. A. Borisovich, V. I. Panasovich, I. F. Guindzich examined a series of structural peculiarities of alcohol oxides.

M. A. Borisovich worked out a luminescence method for the determination of the germinating power of the seed of some kinds of trees.

A. Ya. Prokof'ev obtained good results by the use of luminescence analysis in dentistry.

S. D. Kharlamenko examined the absorption spectra of the aluminum polyacaride complex.

D. A. Markov used several methods for analysing albumin fractions in the blood.

M. M. Pavlyuchenko, O. A. Lazerte, carried out an extensive spectrophotometric examination of the formation of solubilized complexes in solutions.

N. A. Savchenko spectroscopically examined the structure of various alliines.

B. I. Stepanov, A. M. Prior carried out theoretical investigations of the vibration spectra of various silicate crystals.

TITLE: Device for testing the hermeticity of specimens having rolled joints.
Class 42, No. 179054 14 18

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 4, 1966, 92

TOPIC TAGS: pipe, roll forging, metal joining

ABSTRACT: This Author Certificate presents a device for testing the hermeticity of specimens having rolled joints, e.g., in the form of a flange with a rolled-in pipe. The device consists of a hydraulic loading device and a testing chamber. To exclude an axial build-up of pressure on the pipe section and to increase the accuracy of measurement, the flange is fastened by a screw press to the end of the experimental chamber, the lower part of which is equipped with a packing of the chevron type, situated on the outer surface of the pipe. To prevent the influence of press deformation on the hermeticity of the specimen-experimental chamber joint, use is made of a hydraulic press deformation compensator (see Fig. 1).

TITLE: An instrument for photographing discharges in spark counters 19

PERIODICAL: Pribory i tekhnika eksperimenta, March-April 1963, v. 8, no. 2,
54-58

TEXT: The article describes a device for taking pictures of discharges in spark counters from two mutually perpendicular directions and reference marks with a single frame of film in a moving-picture camera that need not be greatly modified for this purpose. The instrument is part of a system for determining the points at which particles enter emulsions. Control is either automatic or manual from a separate control unit; there is provision for double-exposure prevention and malfunction indication. The position of sparks may be determined to within ± 0.1 mm. There are five figures.

the best method of hardening uranium with a view to limiting its increasing radiation. The tests made in this connection included hardening; the uranium samples in the beta- and gamma-phases, followed by the slow-cooling and water-cooling methods. The test results indicate that the texture of hardened uranium is determined primarily by the parameters of the heat treatment of the metal, and the following conclusions are therefore justified: 1) the texture of hardened uranium depends on the nature of the heat treatment but primarily on the duration of exposure to high-temperature phases; 2) the greatest destruction of the texture was noted in the samples that had been heat-treated under the effect of tensions produced by thermal gradients or external efforts, and 3) in the case of low and moderate heating speeds, the texture of hardened uranium is determined to a large extent by the technology of the uranium production and the duration of its exposure in the beta-phase before the hardening. TITLE: Recovery of Mixed Ferrocyanides of Heavy Metals from Hydrosols and Suspensions

PERIODICAL: Zhurnal prikladnoy khimii, 1960, Vol 33, Nr 1, pp 59-61
(USSR)

ABSTRACT: This is the first communication from a series of articles on the use of gelatinous foam for concentration of radioactive cesium solutions. In this work the authors studied separation of colloidal and precipitated ferrocyanides ($K_2Mn\cdot Fe(CN)_6$, $K_4Co_{10}Fe(CN)_{6\cdot 6}$, $K_4Ni_4\cdot Fe(CN)_{6\cdot 3}$, $K_2Zn_3Fe(CN)_{6\cdot 2}$, and $K_2Cu_3Fe(CN)_{6\cdot 2}$) and $Pb_2Fe(CN)_6$ from their solutions by means of gelatin foam. Solutions of potassium ferrocyanide and of the respective metal salts were added to 200 ml of distilled water. After addition of 1% of freshly prepared gelatin solution, the volume of the suspension was brought up to 300 ml,

and the solution was mixed and poured into the foam apparatus shown in Fig. 1. Recovery of the solid phase (colloidal particles and precipitate) was complete after 3-4 min of foaming (since the ferrocyanides are colored, their separation from the solution could be easily seen). Relation between solid phase concentration and minimum quantity of gelatin necessary for the complete recovery of the former is illustrated in Fig. 2. The necessary volume of gelatin solution also depends upon the pH value of the ferrocyanide solution. A neutral or weakly acidic medium was found to be most favorable in the recovery process. For complete recovery of 50 mg of $K_4Ni_4\cdot Fe(CN)_6 \cdot 3$, the volume of the 1% gelatin solution could be decreased 6-fold (from 9.0 ml to 1.5 ml) by changing pH of the solution from 2 to 5. There are 2 figures; and 7 Soviet references.

TITLE:

Extraction of Radioactive Cesium by Mixed Ferrocyanides
of Heavy Metals

PERIODICAL:

Zhurnal prikladnoy khimii, 1960, Vol 33, Nr 1, pp 81-
85 (USSR)

ABSTRACT:

This is the second communication of a series on the gelatin foam method of concentrating radioactive cesium solutions. The first study, which also describes the laboratory apparatus and the preparation of some reagents, is printed on p 59 of this issue (see also Abstract 77501). Radioactive cesium was absorbed by mixed ferrocyanides such as $K_2Mn[Fe(CN)_6]$; $K_4Co_{10}[Fe(CN)_6]_6$; $K_4Ni_4[Fe(CN)_6]_3$; $K_2Cu_3[Fe(CN)_6]_2$; $K_2Zn_3[Fe(CN)_6]_2$; $Pb_2[Fe(CN)_6]$. The solid phase was then separated from the solution by centrifuging at 3,000 rpm in a laboratory centrifuge, or by frothing the

solution with compressed air and collecting the foam with the entrapped Cs¹³⁴-containing precipitate. 1% gelatin and 50% excess of ferrocyanide were used as coagulating agents. The marked effect of the pH of the solution on the extraction is shown in Figs. 1 to 6; full lines designate the foam extraction, dotted lines designate the centrifuging extraction; A is the Cs extraction (in %); and B is the pH value. It was also established that a low concentration of the adsorbent (60 mg/liter) already gave a maximum degree of radioactive cesium extraction. The amount of the solution carried off as foam was approximately 1 to 1.4% of the initial solution volume. Practically 100% extraction was obtained from a solution with pH = 7 in a three-stage procedure. The first extraction yielded 98.84% cesium; the remaining solution was treated with ferrocyanide and gelatin in the same amounts as previously, and the second frothing extracted 89.07% of the remaining cesium. Finally, a third frothing gave 81.98% of the cesium remaining after the second operation, and the total extraction amounted to
